

# **Web Application Development using Python**

**Introduction to Flow Control**

**Prepared by George Khoury**

# Outline

- Comparison Operators
- Logical Operators
- Decisions - `if` statements
- Loops
  - `for`
  - `while`
- `range()`

# Logic and Comparison

# Comparison Operators

W1/S3/ex0.py

Operator	Meaning	Example
>	Greater than	x > y
<	Less than	x < y
==	Equal to	x == y
!=	Not equal to	x != y
>=	Greater than or equal to	x >= y
<=	Less than or equal to	x <= y

# Logical Operators

W1/S3/ex0.py

Operator	Meaning	Example
and	True if both operands are true	x <b>and</b> y
or	True if either of operands is true	x <b>or</b> y
not	True if operand is false	<b>not</b> x

# Flow Control

While Loop Flow of Control

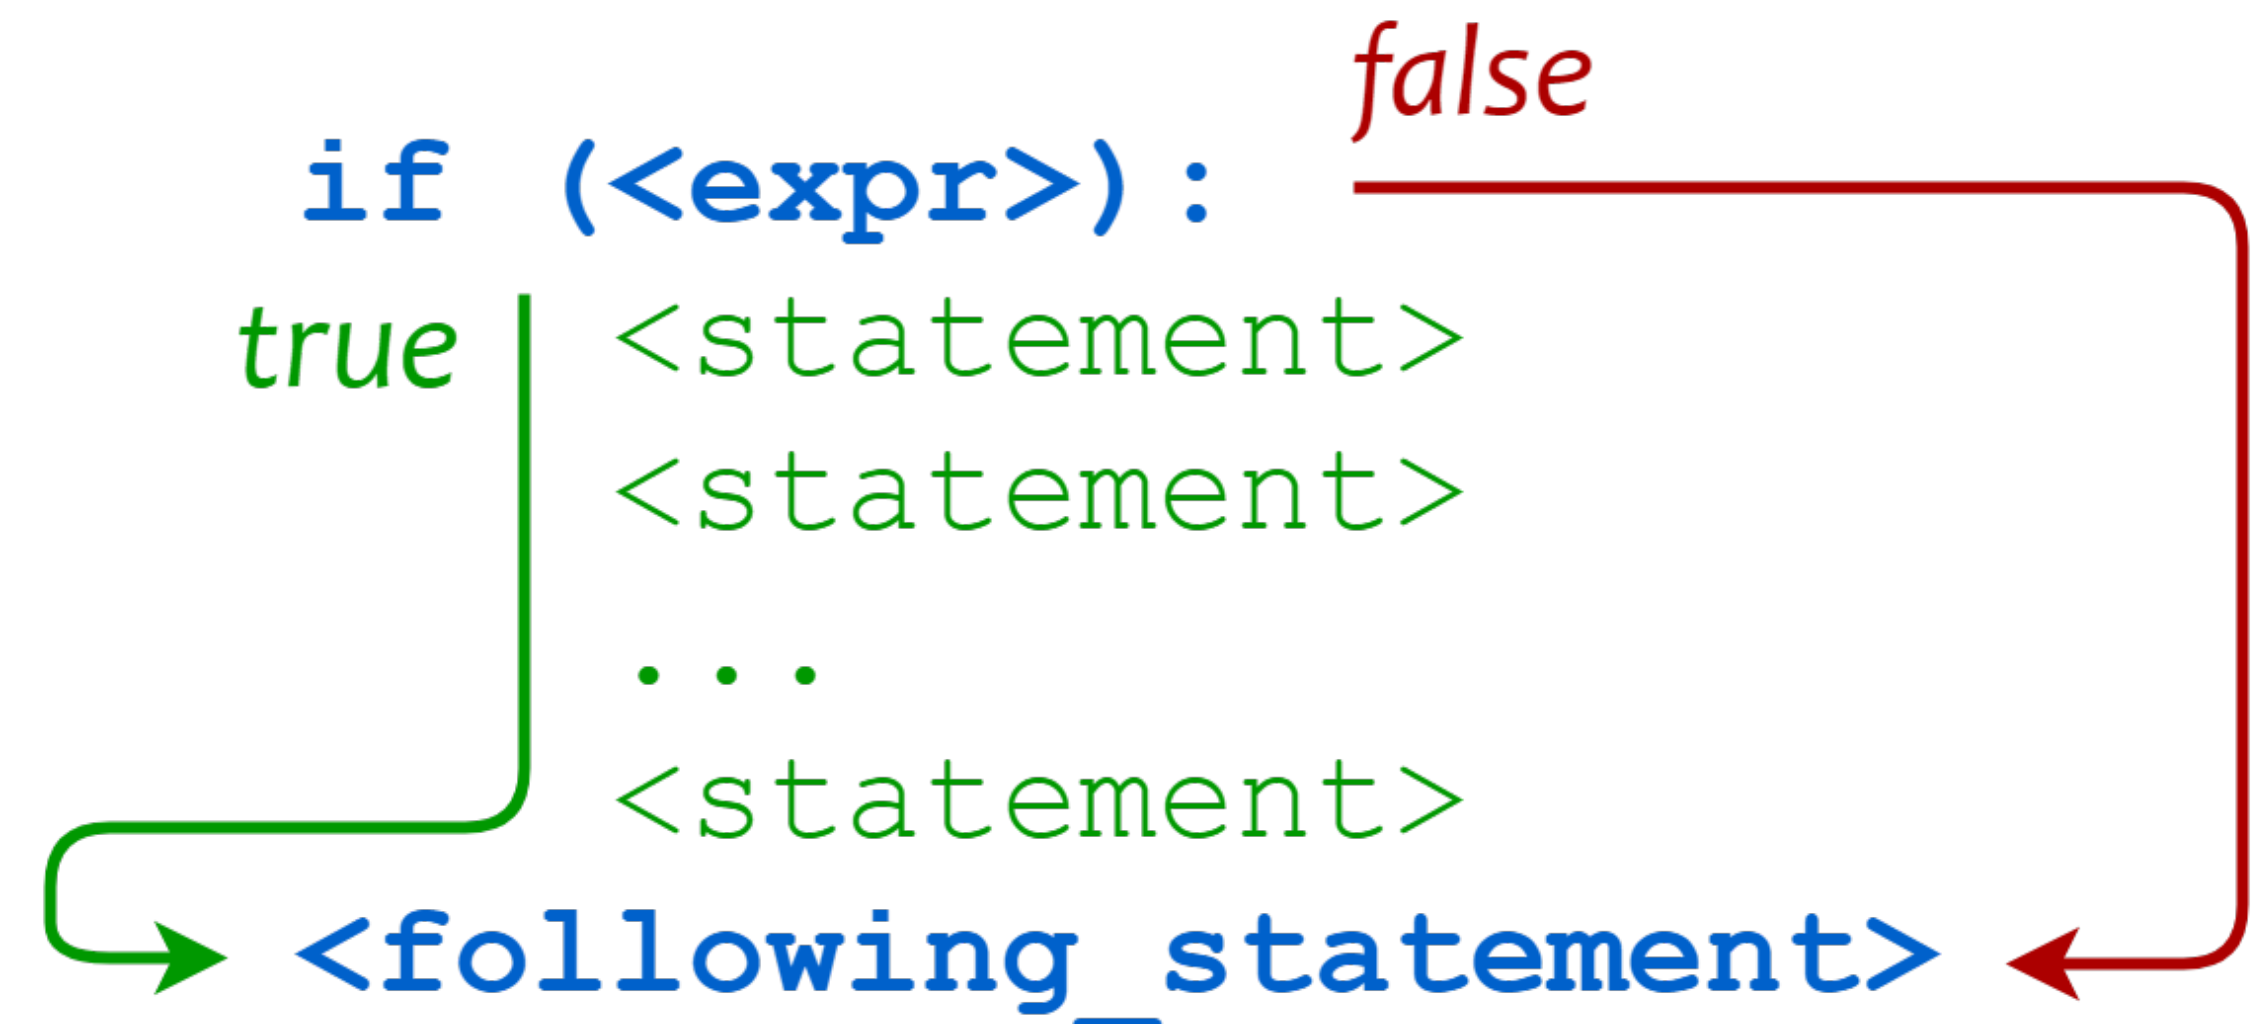

If Statement Flow of Control

# Decisions

W1/S3/ex1.py

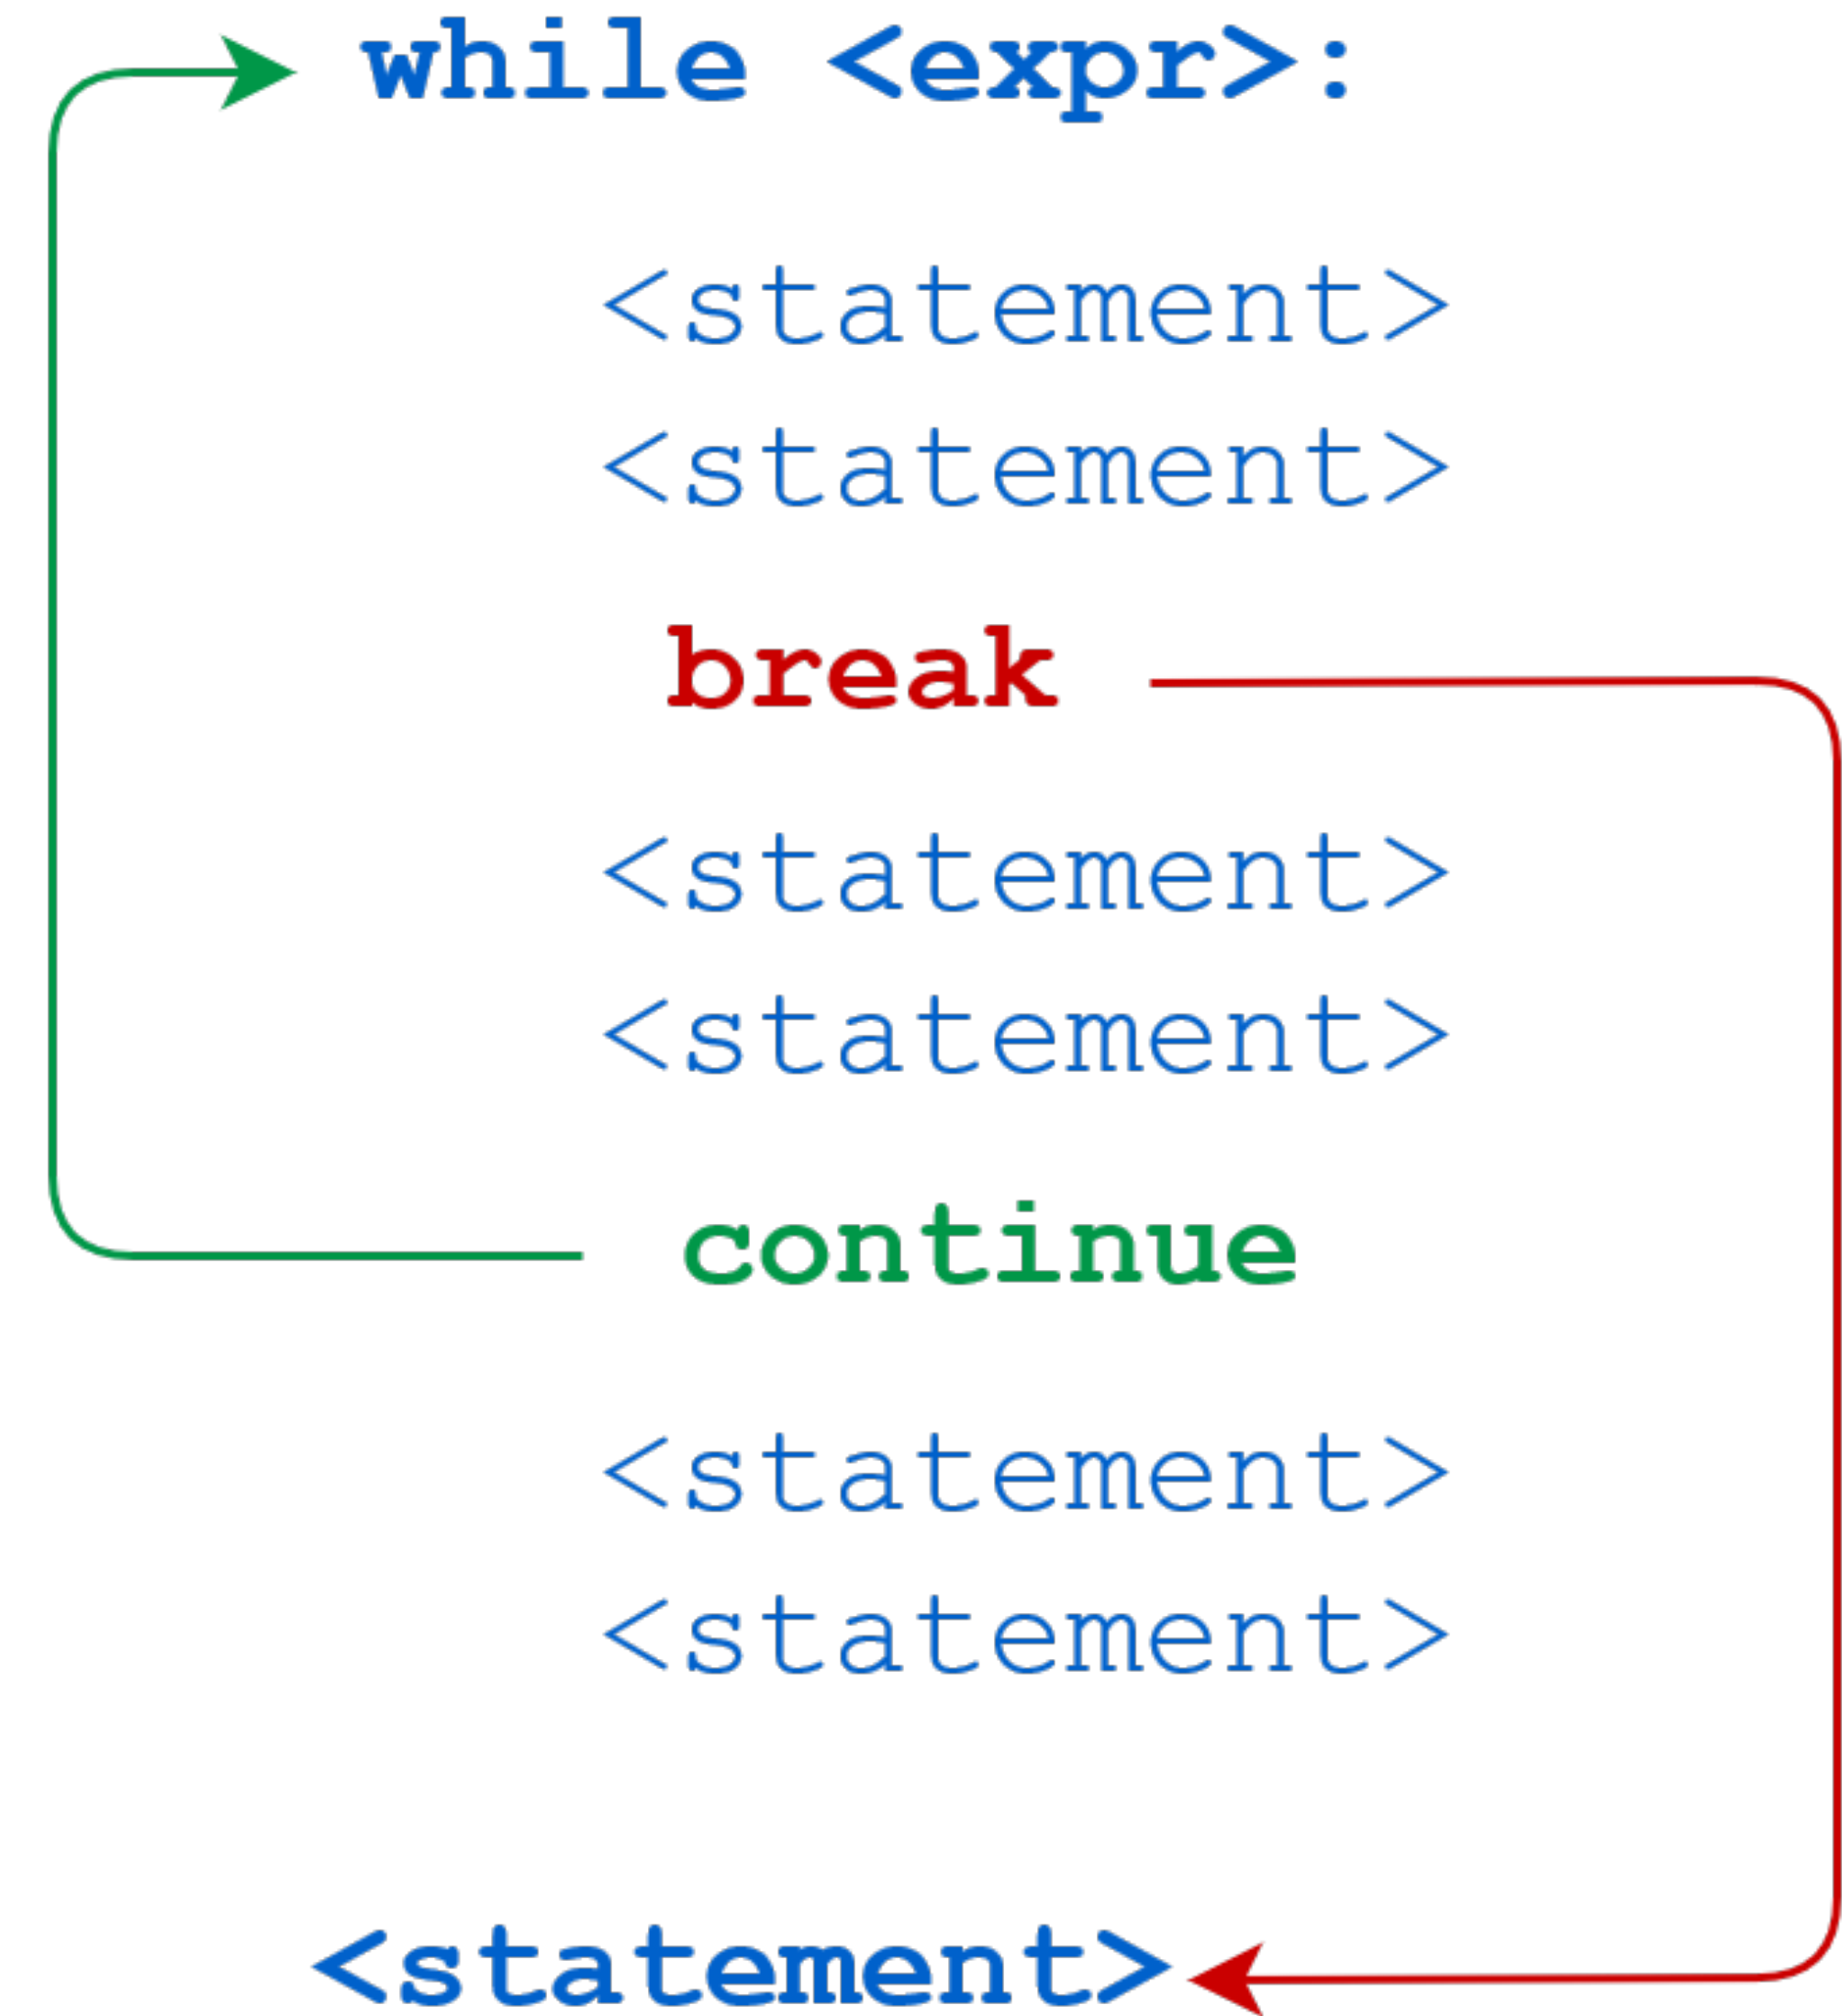

- Decisions are an important part of flow control.
- Decisions allow us to execute certain blocks of code when a particular condition is met.
- In Python we use `if` statements to make decisions.
- **Indentation for the `if` block is very crucial in Python.**

# Loops

W1/S3/ex2.py

- Many Python objects are “iterable”.
  - Which ones did we learn so far?
- Loops allow us to execute certain blocks of code over a controlled number of iterations.
- **Indentation for the `for` or `while` block is very crucial in Python.**

# range()

W1/S3/ex3.py

- If you need to iterate over a sequence of numbers, the `range()` function can help you generate arithmetic progressions.
- The upper bound is never part of the generated sequence
  - `range(10)` generates 10 values, the legal indices for items of a sequence of length 10.

$$a_n = a_1 + (n - 1)d$$

*$a_n$*  is the  *$n^{\text{th}}$  term in the sequence* (green arrow).  
 *$a_1$*  is the *1<sup>st</sup> term in the sequence* (blue arrow).  
 *$n$*  is the *number of terms in the sequence* (orange arrow).  
 *$d$*  is the *common difference* (red arrow).
